Can an optical coupler be measured using a multimeter on the 10k range

Overview

For precise optoisolator checks, use an analog multimeter, testing the LED in the 1-ohm and 10k-ohm ranges. A simple optocoupler test setup requires a power source, LED, resistors, and a pushbutton switch. Design considerations, including adequate spacing on PCBs for insulation, must be followed to ensure performance remains reliable and safe. The. Optocouplers use light to transmit signals, physically separating the input and output sides of a circuit, thus preventing unwanted electrical interference and potential damage. This isolation is paramount in applications ranging from power supplies and industrial control systems to medical. Testing an optocoupler with a multimeter is a straightforward process that can help determine its functionality. You can test a photocoupler with a multimeter. This checks if its output changes when you power its input.
