

Circular ventilation holes in the distribution box

Overview

Ventilation holes in corrugated boxes are precisely designed openings, typically die-cut, strategically placed in the walls of the box. These are not random punctures; they are engineered features intended to facilitate controlled airflow. To avoid over-pressurising in a box, venting holes must be applied. Also a rule of thumb expression is given to estimate the cross-section of the venting. When galvanizing hollow fabrications, ASTM A385 contains the primary information on the minimum openings and locations for vent and drain holes to prevent air from being trapped during immersion in cleaning solutions or molten zinc. Additionally, figures are provided for clarity to describe some. Let's establish a clear understanding of what ventilation holes are in the context of corrugated boxes and why they are so important.
