

Conductivity of switchgear busbar

Overview

Copper offers an electrical conductivity of approximately 58 MS/m, versus 35 MS/m for aluminum — roughly 65 % of copper's value. This means an aluminum conductor bar requires a larger cross-sectional area to carry the same current, typically by a factor of 1.6× in. A busbar is a metal bar, usually made of copper or aluminum, that carries electricity inside switchgear. It connects the incoming power to circuit breakers and outgoing circuits, helping power flow smoothly and evenly. Good busbar design helps prevent overheating and electrical faults. These busbars are not merely simple current conductors; they serve as the strategic backbone, interconnecting various components within the. Core idea: A busbar is a conductive bar or assembly that creates a common current distribution point inside electrical equipment. Engineering use: Busbars are common in switchgear, panelboards, substations, busway, battery systems, and industrial power distribution equipment.
