Fire protection requirements for distribution box enclosures standards

Overview

ABB offers an innovative enclosure system for fire prevention, which is constructed of fireproof materials, features optimum technology and is available in a variety of economical designs.

Key Takeaways

Distribution box enclosures must be constructed from non-combustible or fire-resistant materials and meet specific fire resistance ratings such as F30/F90, I30/I90, or E30/E90 according to international and national standards.

Fire Resistance and Material Requirements

Distribution enclosures should be made of non-combustible or fireproof materials to prevent fire propagation and maintain functionality during a fire. Fire resistance ratings are commonly defined as: F30/F90: Fire resistance duration of 30 or 90 minutes for the enclosure structure. I30/I90: Interior fire protection, ensuring internal components are shielded for 30 or 90 minutes.

E30/E90: Exterior fire protection, preventing fire spread outside the enclosure for 30 or 90 minutes. Testing for these classifications is typically conducted according to DIN 4102 Part 2, 11, and 12 standards for European enclosures. Regulatory StandardsIEC 60364: International standard for electrical installations, including protection against thermal effects and fire hazards.

S 7671 (UK Wiring Regulations): Requires switchgear or controlgear in escape routes to be enclosed in non-combustible or not readily combustible materials.

CE

I 64-8 / CENELEC HD 384: Specifies protection levels for enclosures in various environments, including high fire risk areas, with IP55 or higher protection for dust and water ingress.

Fire Protection Systems

Modern enclosures may include intumescent linings or fire-resistant covers that expand during a fire to seal gaps and prevent rapid fire spread. These systems can be retrofitted to existing consumer units and comply with IET Wiring Regulations and relevant building regulations.

Installation Considerations

Enclosures must be installed following manufacturer instructions and state-of-the-art procedures. Ventilation openings should automatically close in the event of fire to maintain fire integrity. The protection class of the distribution board corresponds to the lowest-rated component if multiple protection levels are used.

Summary

To ensure fire safety, distribution box enclosures should: Be made of non-combustible or fire-resistant materials. Meet fire resistance ratings (F30/F90, I30/I90, E30/E90). Comply with IEC, BS 7671, or CEI 64-8 standards depending on location.

Include fire protection systems like intumescent linings where necessary. Be installed according to manufacturer and regulatory guidelines to maintain protection integrity. These measures collectively reduce fire risk, protect internal components, and ensure compliance with international and national fire safety standards.
