

How thick is the panel of the distribution box

Overview

Electrical Distribution Panel Guide: Types, Sizing & 600 Amp Tips From residential 100-amp panels to massive 600 amp main distribution panels in commercial.

Key Takeaways

Distribution box panels are typically fabricated from 2.0 mm thick steel for load-bearing parts and 1.6 mm for non-load-bearing components.

Standard Thickness Specifications
Load-bearing panels: Most distribution boxes, including LT (Low Tension) distribution boxes, use 2.0 mm thick CRCA (Cold Rolled Close Annealed) or GI (Galvanized Iron) steel sheets for the main body to ensure structural strength and durability.

Non-load-bearing parts: Doors, front covers, and side panels are usually 1.6 mm thick, providing sufficient protection while reducing weight.
Outdoor boxes: For outdoor applications, panels are reinforced with channels and fabricated from 2 mm GI sheet steel, often with slanted roofs and overhangs to prevent water ingress.

Additional Considerations
IP Rating: Thickness is often paired with the degree of protection; for example, IP54 or IP55-rated boxes require robust panels to prevent dust and water ingress.
Reinforcement: Load-bearing panels may include additional channels or studs to support mounting of busbars, MCCBs, or MCBs without deformation.
Material: CRCA steel is commonly used for indoor panels, while GI steel is preferred for outdoor panels due to corrosion resistance.

Customization: Some manufacturers offer modular panels with adjustable nuts and studs for easy installation and maintenance, which may slightly affect panel thickness in specific areas.

Summary

For most residential, commercial, and industrial distribution boxes: Main body / load-bearing panels: 2.0 mm
Doors / non-load-bearing panels: 1.6–2.0 mm

Outdoor reinforcement: 2.0 mm GI steel with structural channels
These specifications ensure mechanical strength, safety, and compliance with electrical installation standards while accommodating protective devices and wiring.
