Lights at the router s fiber optic connection

Overview

Understanding LED Indicators on a Fiber Router Let''s break down what the common LED lights on a fiber router mean and how they behave: 1. POWER Normal: Solid/stagnant light.

Key Takeaways

The lights on a fiber optic router indicate power, fiber signal, Ethernet connection, data transmission, and sometimes phone service, with colors and patterns showing their status.

Key Lights and Their Meanings

Power Light: Indicates whether the router or ONT is receiving power. A solid green light means the device is powered on and functioning normally, red indicates a power issue, and off means no power is detected. Check the power cable and outlet if the light is off.

Fiber/

Link Light: Shows the connection to the ISP's fiber network. Solid green means a proper fiber signal is received, amber/yellow indicates a weak or initializing connection, red signals a failed connection, and off means no connection.

Ethernet/

Data Light: Indicates the status of the connection between the router and connected devices. Solid green shows a device is connected and transmitting data, flashing green indicates active data transfer, amber/yellow signals slow or intermittent transmission, red indicates failure, and off means no data is being transmitted. WAN/Internet Light: Confirms internet connectivity.

Solid green or blue means the router is connected to the internet, flashing indicates data is being exchanged, and red or off signals no connection or a problem with the ISP. Phone/VoIP Light (if applicable): Shows the status of home phone service. Solid green indicates active service, and off means the phone is not connected or service is inactive.

Alarm/

Error Light: Alerts to faults or errors. Red indicates a detected error, while off means no issues.

Interpreting Patterns

Flashing lights usually indicate activity, such as data transmission or the device initializing. Slow, steady blinking often means the device is attempting to establish a connection. Rapid blinking typically represents active data transfer and is normal during internet use.

Understanding these lights helps quickly identify whether your fiber optic router is functioning correctly or if troubleshooting is needed, such as checking cables, restarting devices, or contacting your ISP.
