

Main power switch connected to distribution box

Overview

Here, a double pole MCB is used as the Main MCB or Main switch. The single input supply (phase and neutral) is connected to. A distribution board or distribution box is where the main power supply is distributed to multiple loads. Distribution Board also known as “Panel Board”, “Switch & Fuse Board” or “Consumer Unit” is a box installed in the building containing protective devices, such as circuit breaker, fuses, isolator, switches, RCDs and MCBs etc. 2 kV on the primary side and step it down to 120V single-phase and 120/240V split-phase for residential applications. It includes isolator, RCCB (Residual current circuit breaker) or RCD (Residual-current device) devices, protective fuses or MCB's (Miniature Circuit Breaker). The Atlas Copco high voltage controllers are designed to be used together with the Main Switch Box or Main Switch Box II and the Distribution box or Distribution Box II units. If the controllers are not connected to a Main Switch Box or a Main Switch Box II, with the option of also connecting a Main switch consumer unit - Consists of a main switch that will disconnect power to all circuits simultaneously which has one busbar linking all protective devices to a common live source, and one neutral conductor or link bar connecting to a common neutral rail. There will be a separate earth rail.
