Nanofiber type sensor

Overview

Nanofibers are known for their exceptional surface area and wide opportunities for their functionalization. These properties have been attractive for various sensing applications; however, mostly electric sensing principles have been reported. An overview of most frequently studied concepts will be. Integrating polymer nanofibers with optical sensors takes advantage of the high sensitivity, fast response, and strong immunity to electromagnetic interference of optical sensors, enabling widespread use in biomedical science, environmental monitoring, food safety, and other fields. By combining the advantages of electrospinning and triboelectric nanogenerators. Because of their properties, such as high surface area to volume ratio, nanofibers (NFs) have been studied and used to develop sensors with higher loading capacity, better sensitivity, and faster response time. They also allow to miniaturize designed platforms. One of the most commonly used.

Article Content

Functional Nanofibers for Sensors

Various functionalized nanofiber materials have been used to demonstrate feasibility of realization of miniature sensors of biomedical and

Nanofibers enabled advanced gas sensors: A review

• A comprehensive review of nanofibers as sensing components for various gases. • Thoroughly discuss regarding the working mechanisms of nanofiber-based sensors. • Highlight future

© 2026 CJC FIBRE CONSULTANTS - All rights reserved

Wafer-level high performance MIM humidity sensor based on

MIM humidity sensor with nanofiber-microcavity structure is proposed. Wafer-level fabrication ensures CMOS compatibility and high scalability. Sensor achieves simultaneous high

Recent Development of Polymer Nanofibers in the Field

Integrating polymer nanofibers with optical sensors takes advantage of the high sensitivity, fast response, and strong immunity to electromagnetic

Single and bundled carbon nanofibers as ultralightweight and flexible ...

This work demonstrates the application of electrospun single and bundled carbon nanofibers (CNFs) as piezoresistive sensing elements in flexible and ultralightweight sensors.

Recent Advances in Electrospun Nanofiber-Based Self

This review presents a comprehensive overview of recent progress in electrospun nanofiber-based TENGs, covering their working principles, operating

Electrospun Micro/Nanofiber-Based Biomechanical Sensors

First, a brief overview of the design approaches of electrospun flexible biomechanical sensors based on the working mechanism is highlighted. Then, two kinds of preparation strategies

High-sensitivity acoustic sensors from nanofibre webs

The sensor devices show much higher sensitivity than commercial piezoelectric PVDF film. They also have an incredible ability to distinguish sound waves in the low to middle frequency

All-Nanofiber Iontronic Sensor with Multiple Sensory Capabilities for ...

Herein, an all-nanofiber flexible breathable iontronic sensor based on polyacrylonitrile (PAN) nanofiber membrane doped with ionic liquid (IL) is prepared by electrospinning technique.

Electrospun Nanofibers for Sensing and Biosensing

This review presents numerous examples of recently published nanofiber-based electrochemical and optical sensors and biosensors for the detection of various

Carbon Nanofiber-Based Functional Nanomaterials for Sensor ...

In addition, the sensor applications of CNF-based nanomaterials for detecting gas, strain, pressure, small molecule, and biomacromolecules are demonstrated in detail.

Wafer-level high performance MIM humidity sensor based on nanofiber ...

This work presents a novel wafer-level MIM humidity sensor based on a PI nanofiber-microcavity hierarchical structure. An innovative two-step plasma etching process was employed to

Advancements in Nanofiber-Based Electrochemical Biosensors for

This review provides an overview of the current research activities in nanofiber-based electrochemical biosensors for diagnostic purposes. The clinical applications of these

Weavable and stretchable piezoresistive carbon nanotubes-embedded ...

In this paper, stretchable piezoresistive carbon nanotubes-embedded nanofiber sensing yarns are successfully produced and mechanically robust enough to be woven to a wearable textile

Micro/nanofiber-based noninvasive devices for health monitoring ...

Here, the latest successful examples of micro/nanofiber based flexible and wearable human vital signs monitoring sensors in the form of film, mat, yarn, fabric, textiles, etc., are outlined

Recent advances in carbon nanofibers and their applications – A review

Although electrospun carbon nanofiber-based sensors for H 2 O 2 detection are used widely for industrial applications , , recently their application in the biomedical sector is also

Electrospun Nanofibers for Sensing and Biosensing

Electrospun NFs can be used in different types of sensors and biosensors. This review presents recent studies concerning electrospun

Electrospun nanofiber/hydrogel composite materials and their tissue ...

Nanofiber/hydrogel composites can provide many advantages for 3D cell culture, including improved mechanical strength, water absorption properties, and the ability to promote cell
