Primary Optical Distribution Box Structure

Overview

An Optical Distribution Frame (ODF) is a dedicated unit designed to organize, terminate, and interconnect fiber optic cables. It brings together fiber splicing, patching, and cable routing in a single structure, while shielding sensitive connectors and splices from mechanical stress or. The optical fiber distribution box is to protect the connection point where the optical cable is connected to the user end, so that the optical cable access point is stable, dustproof and waterproof. Minimize the interference of the optical cable access signal to the external environment. They provide efficient fiber optic management, connectivity, and protection. As data centers, enterprises, telecom operators, and smart-building infrastructures deploy increasingly dense fiber links, ODFs provide the structured.
