

ST type pigtail fiber

Overview

ST Pigtail ST Pigtail A fiber optic pigtail is a short length of optical fiber cable Fiber Patch Cord & Pigtail: Types, Specifications & Selection | Opelin.

Key Takeaways

ST in a fiber optic pigtail refers to a bayonet-style connector used to terminate one end of the fiber, providing a secure and reliable connection. What is an ST Pigtail?

An S

T pigtail is a short length of optical fiber cable with a factory-terminated ST connector on one end and a bare fiber on the other end, designed for splicing to a main fiber optic cable or connecting to network equipment such as switches, routers, or transceivers (Fiberik),. Unlike patch cords, which have connectors on both ends, the bare fiber end of a pigtail is intended for fusion or mechanical splicing, creating a permanent, low-loss connection in the field (Ampcom),.

S

T Connector FeaturesBayonet-style locking mechanism: The ST connector uses a push-and-twist design, ensuring a secure connection that resists accidental disconnection (Network-Switch),. Round ferrule: Typically 2.5 mm in diameter, which aligns the fiber precisely for minimal signal loss and reflection.

Durability: ST connectors are robust and were widely used in early LANs and industrial environments where reliability is critical. **Applications:** Common in legacy networks, optical distribution frames (ODFs), and some industrial setups. While largely replaced by LC and SC connectors in modern high-density networks, ST connectors remain in use for certain legacy or durable installations (Anetfiber),.

Advantages and Considerations

Secure connection: The bayonet-style lock prevents accidental disconnection. **Ease of installation:** Simple push-and-twist mechanism allows quick mating and demating. **Compatibility:** Works with both single-mode and multi-mode fibers, though mostly found in older systems.

Limitations: Larger form factor compared to LC connectors, making them less suitable for high-density applications. The exposed ferrule can be more prone to dust contamination if not properly protected (Network-Switch),.

Summary

In essence, an ST pigtail combines the precision of a factory-terminated ST connector with the flexibility of a bare fiber end for splicing. It is particularly useful in legacy networks, industrial environments, and situations requiring durable, secure connections, bridging the main fiber optic cable to network devices efficiently and reliably (Fiberik),.
