

Technical Standards for Phosphated Steel Wire in Optical Cables

Overview

This document is applicable to galvanized and phosphated round carbon steel wire for tension members of optical fiber cable (hereinafter referred to as the steel wire).

Key Takeaways

Phosphated steel wire for optical cable reinforcement is manufactured according to international standards such as GB, JIS, DIN, AISI, and EN, ensuring high strength, corrosion resistance, and compatibility with cable coatings.

Applicable Standards

Phosphated steel wires used in optical cable reinforcement are typically produced following recognized standards to ensure consistent mechanical and chemical properties: GB (China National Standard): Specifies carbon steel wire properties, tensile strength, and surface treatment for optical cable applications.

Jl

S (Japanese Industrial Standard): Defines wire dimensions, mechanical performance, and phosphating requirements for optical fiber cable reinforcement.

DI

N (German Institute for Standardization): Covers steel wire quality, phosphating coatings, and corrosion resistance for optical cables.

AIS

I (American Iron and Steel Institute): Provides material grades and chemical composition guidelines for steel wires used in optical cable reinforcement.

E

N (European Norm): Specifies mechanical properties, surface treatment, and testing methods for phosphated steel wires in optical cables.

Phosphating Process and Types

Phosphating is a surface treatment that enhances wear resistance, corrosion protection, and adhesion to polymer coatings:

- Manganese Phosphating:** Forms a dense crystalline layer, ideal for harsh environments, underground cables, and long-haul telecom infrastructure.
- Zinc Phosphating:** Provides good corrosion resistance and a slightly textured surface suitable for polymer adhesion, commonly used in general-purpose optical cables.
- Amorphous Phosphate Coating:** Thin layer used as a pretreatment for further coatings, suitable for indoor or secondary protection systems.

Organic-

Inorganic Hybrid Phosphate: Combines inorganic phosphates with organic compounds to improve adhesion and barrier protection.

Performance Requirements

Phosphated steel wires for optical cables must meet the following criteria:

- High tensile strength to support cable weight and resist mechanical stress.
- Strong lateral pressure resistance for protection against bending, crushing, or external loads.
- Corrosion resistance to withstand moisture, chemicals, and environmental exposure.

Compatibility with polymer jackets to prevent galvanic corrosion and ensure long-term cable reliability.

- Surface uniformity to facilitate smooth cable manufacturing and reduce fretting fatigue.

Practical Considerations

Phosphating is often combined with other protective measures such as galvanization or polymer encapsulation in aggressive environments. Manufacturers follow IEC, IEEE, and ISO guidelines for cable design and installation to ensure safety and long-term functionality. Advanced cleaning and processing methods, such as multi-stage washing and friction-based roll systems, are used to prepare phosphated steel wires for further processing, improving wear resistance and reducing fretting fatigue.

In summary, phosphated steel wire for optical cable reinforcement adheres to international standards (GB, JIS, DIN, AISI, EN) and undergoes specialized surface treatments to ensure mechanical strength, corrosion resistance, and compatibility with cable coatings, making it suitable for a wide range of optical cable applications.

Article Content

GB/T 24202-2021 English PDF

This document is applicable to galvanized and phosphated round carbon steel wire for tension members of optical fiber cable (hereinafter referred to as the steel wire).

Phosphated Steel Wire for Optical Cable

Wires with diameter above 1.0 mm are cold drawn and then phosphated, wires below 1.0 mm require heat treatment. -The phosphated surface provides excellent lubrication and rust resistance, serving

GB/T 24202-2021: Carbon steel wire for tension (English PDF)

This document is applicable to galvanized and phosphated round carbon steel wire for tension members of optical fiber cable (hereinafter referred to as the steel wire).

GB/T 24202-2021 English, GB/T 24202-2021 Carbon steel wire for

This document is applicable to galvanized and phosphatized round carbon steel wire used as tension member for optical fiber cable (hereinafter referred to as steel wire), and steel wire used for cable

The Science Behind Phosphating Steel Wire For Optical Cable:

Different phosphating techniques are employed based on specific application requirements such as exposure to moisture, chemical environments, or the need for adhesion to polymer jackets and

GB JIS DIN AISI En Standard Phosphated Steel Wire for Optical

The steel wire in the optical cable provides important support and protection for the cable through its unique physical and mechanical properties, ensuring the stable transmission of communication

Phosphated steel wire for optical cables

Phosphated steel wire for optical cables is a type of steel wire coated with a phosphating layer on the surface, which has good corrosion resistance while maintaining the strength of the steel wire itself.

CN114308867A

The invention relates to the field of phosphated steel wires, in particular to an external processing method of a phosphated steel wire for reinforcing an optical cable.

JIS DIN AISI En10270 Phosphated Steel Wire for Optical Cable

We provide various specifications, various models of smooth and galvanized steel wire and elevator wire rope. The main products are: All kinds of carbon spring steel wire, rope steel wire.

Handbook Optical fibres, cables and systems

ITU-T has been active in the standardization of optical communications technology and the techniques for its optimal application within networks from the infancy of this industry. However, it is not always

The Science Behind Phosphating Steel Wire For Optical Cable:

The phosphated steel wire provides essential tensile strength to protect delicate optical fibers from mechanical stress during installation and operation. Its corrosion resistance ensures uninterrupted

Handbook Optical fibres, cables and systems

The simultaneous availability of compact sources and of low-loss optical fibres led to a worldwide effort for developing optical fibre communication systems. The real research phase of fibre-optic
