UK Fiber Optic Cable

Overview

This comprehensive guide explores these cables, how they work and what they are used for, as well as the different types that are available.

Key Takeaways

The UK primarily uses single-mode fibre optic cables for full-fibre broadband, with Openreach, Virgin Media, and other providers deploying FTTP/FTTH networks using connectorised E-Z bend cables for in-home installations. Types of Fibre NetworksFull-fibre (FTTP/FTTH): This network uses fibre optic cables from the exchange directly to the home or premises, ensuring high-speed, low-latency connections. Openreach has deployed FTTP to over 19.

2 million premises, while Virgin Media and altnets like CityFibre, Hyperoptic, and Community Fibre are expanding coverage to reach roughly 80% of UK premises. Full-fibre networks use single-mode glass fibre, which supports long-distance, high-bandwidth transmission. Fibre to the Cabinet (FTTC): Many UK connections still use FTTC, where fibre runs to a street cabinet and copper lines carry the final stretch to homes.

This hybrid approach limits maximum speeds compared to full-fibre networks. Cable broadband (DOCSIS): Virgin Media operates a national cable network using fibre to the street and coaxial copper for the last mile. Newer deployments, such as Nexfibre, are rolling out XGS-PON fibre, which supports symmetric high-speed connections up to 2.

5 Gbps. Fibre Cable TypesSingle-mode fibre: Predominantly used for UK broadband networks, it has a small core diameter and is ideal for long-distance, high-speed data transmission.

Connectorised E-

Z bend cable: Used for in-home installations by Openreach, this flexible cable allows installers to route fibre through walls and ceilings without damaging the fibre. Multi-strand glass fibre: Often used in outdoor or backbone deployments, these cables contain multiple fibres within a protective sheath, suitable for high-capacity networks.

Key Providers and Deployment

Openreach (BT): Largest UK fibre network, deploying FTTP with single-mode fibre and connectorised E-Z bend cables inside homes. Plans aim to reach 25 million premises by the end of 2026. Virgin Media: Uses DOCSIS 3.

1 for most of its network but is upgrading to full-fibre FTTP by 2028, also using single-mode fibre for new deployments. Altnets: CityFibre, Hyperoptic, Community Fibre, and others deploy full-fibre networks using single-mode fibre and XGS-PON technology for symmetric high-speed connections.

Summary

In the UK, single-mode fibre optic cables dominate full-fibre broadband, with connectorised E-Z bend cables used for in-home routing. FTTP/FTTH networks provide the fastest and most reliable connections, while FTTC and DOCSIS hybrid networks remain in use in some areas. The choice of cable type and network depends on the provider, deployment stage, and whether the connection is full-fibre or hybrid.
